

Vertical Text on a Path

You can create vertical text on a path using the Pro software to put a word down the edge of a page on a path of your choice.

First create your path and your word(s).

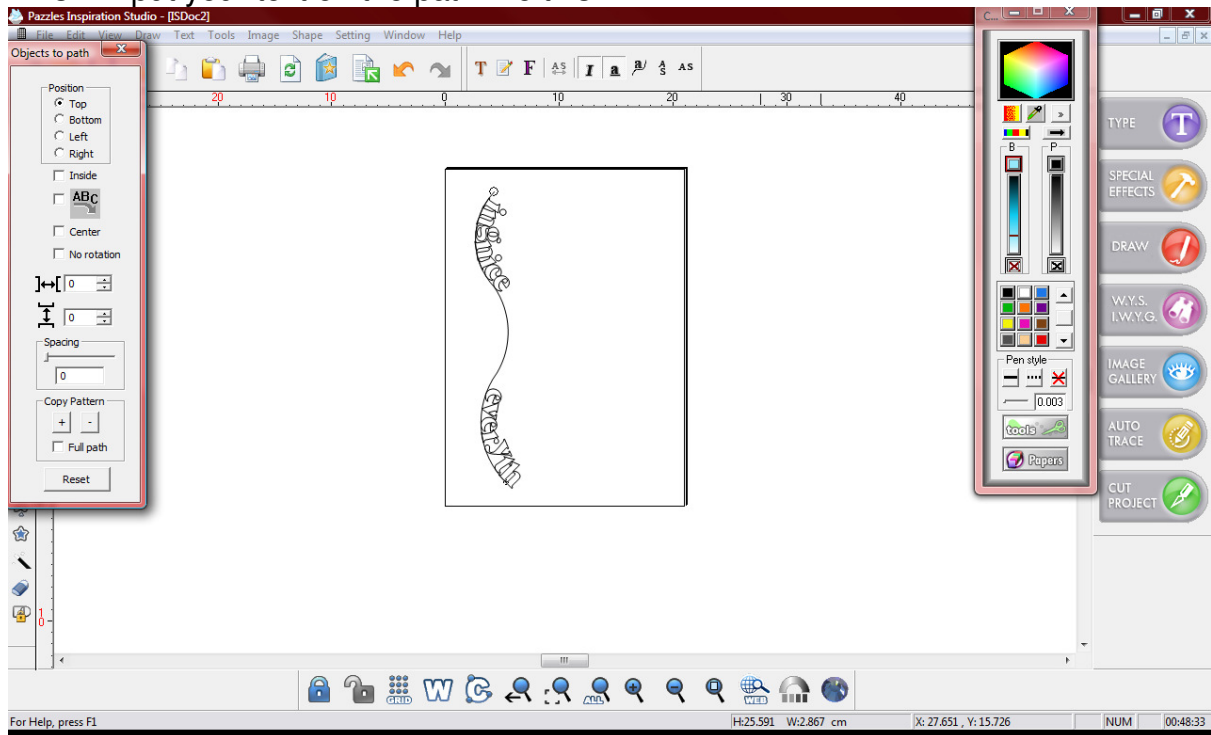

Make your Text vertical using the new vertical text tool (red arrow below)

Next select the text and break text by character (Text-> Break Text-> Break by character)

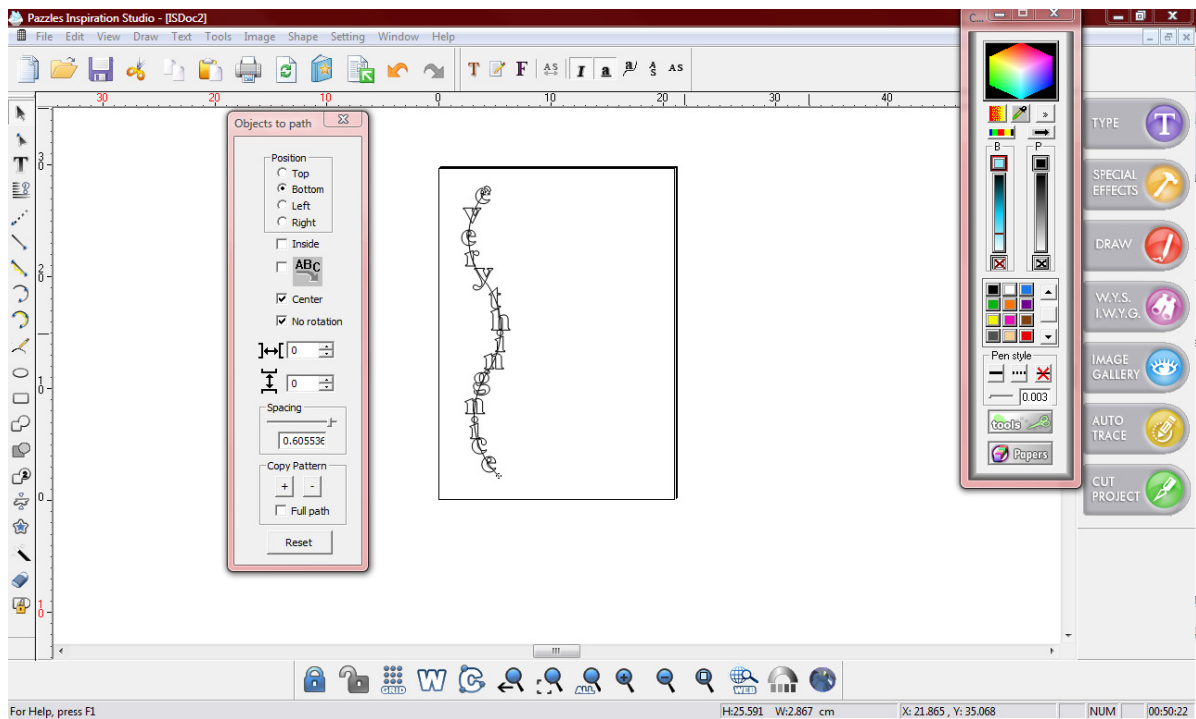

Now select the text and your path and go to Shape-> object to path

This will put your text on the path like this

Now you make adjustments in the Object to path window

Select Bottom, Center, No rotation, adjust spacing to suit you

You may have to do some slight adjustments to prevent overlaps and create a space between words if you have used more than one word. Once done you can delete the original path (I had to zoom in to be able to select the original path).
